800G Technical Support for Pluggable Optical Modules

Overview

High-Speed Interconnects: Backend network requires high speed 100G/200G or 800G optics to connect servers and network switches.

Key Takeaways

800G Active Optical Modules (AOCs) require careful testing, compatibility verification, and vendor-specific support to ensure reliable high-speed data transmission. Overview of 800G AOCs800G AOCs are high-speed optical transceivers designed for data centers and high-performance computing environments, supporting bandwidths up to 800Gbps per module. They are available in QSFP-DD800 and OSFP800 form factors, with duplex LC or MPO connectors depending on the interface type, and can support dual 400G or multiple 100G channels for flexible deployment.

These modules are critical for upgrading from 400G to 800G networks, providing higher port density, lower power per gigabit, and scalable network expansion.

Testing and Performance Verification

Proper testing of 800G AOCs is essential to ensure stable operation and compliance with technical specifications. Key testing procedures include: Signal integrity and protocol testing: Verifying data transmission across multiple interfaces and protocols to ensure low bit error rates. Optical performance testing: Measuring output power, sensitivity, and eye diagrams to confirm module reliability.

Port inspection and cleaning: Using automated cleaning solutions to maintain optimal optical performance and prevent signal degradation. Return loss and wavelength scan testing: Ensuring minimal signal reflection and verifying performance across the full transmission band. Dimension Technology and other vendors provide modular testing platforms that support these procedures, enabling efficient deployment and quality assurance for 800G production lines.

Vendor-

Specific Support

Cisco: Offers QSFP-DD and OSFP 800G ZR/ZR+ coherent optics for distances up to 120 km (800ZR) or over 1000 km (800G ZR+), compliant with QSFP-DD and OSFP MSAs. Cisco provides technical documentation and support for their modules. Juniper Networks: Supports OSFP800 and QSFP-DD800 transceivers.

JTA

C provides full support for Juniper-supplied modules but does not cover third-party optics, which may risk thermal damage or reduced lifespan. Arista: Provides 800G transceivers, AOCs, DACs, and AECs with flexible breakout options and interoperability with existing 400G/100G optics.

F

S Technology: Offers comprehensive 800G data center solutions, including QSFP-DD/OSFP modules with DSP chips for lower power consumption and flexible network upgrades.

Best Practices for Deployment

Verify compatibility: Ensure the AOC form factor and interface match the host device specifications. Use vendor-qualified modules: Avoid third-party optics unless explicitly supported to prevent equipment damage. Perform pre-deployment testing: Conduct optical and signal integrity tests to confirm module performance.

Maintain cleanliness: Regularly inspect and clean optical ports to prevent signal loss. Monitor thermal conditions: High-power modules may require adequate cooling to maintain reliability. By following these guidelines and leveraging vendor support, 800G AOCs can be deployed efficiently, ensuring high-speed, reliable data transmission in modern data center networks.

400G, 800G, and Terabit Pluggable Optics:

High-Speed Interconnects: Backend network requires high speed 100G/200G or 800G optics to connect servers and network switches. These high bandwidth connections are essential for handling the data

800G Client Optics in the Data Center

The OSFP specification was expanded in 2021 to include support for 800G modules with 100G PAM4 lanes (OSFP800) and increased module power support to support a maximum of approximately 30W

Configuring 800G Optics

To support 800G modules, configure the mode as 800 on the designated port pairings. This setup activates the primary port for 800G module insertion while disabling the secondary port in each pair.

800G Optics

Software integration into Junos® OS and Junos OS Evolved provides seamless optics recognition and management. Juniper Networks Technical Assistance Center offers full technical support.

Linear Drive Pluggable (LPO) Early Adoption: 800G Engineering

What Is Linear Drive Pluggable (LPO)? Linear Drive Pluggable (LPO) is a DSP-less optical transceiver architecture designed for 800G and future 1.6T Ethernet networks. Unlike

800G OpenZR+

Now the industry is looking to the OpenZR+ MSA group for guidance addressing similar applications with 800G coherent optical transceivers in small form-factor pluggable modules.

FS Launches 800G LPO Module: A Power Efficiency and Latency

FS introduces an 800G LPO optical module, powering AI and HPC data centers with ultra-low power consumption, reduced latency, and proven reliability.

800G LPO QSFP-DD800 Optical Transceiver for AI/HPC Data Centers

By leveraging linear pluggable optical (LPO) technology, these modules minimize on-module digital signal processing, reduce power consumption per port, and support scalable, high
