Classification of Power and Lighting Distribution Boxes

Overview

Learn what a distribution box is, its types, and how to choose the right one for your project. Includes clear examples and expert tips.

Key Takeaways

Power and lighting distribution boxes are classified based on structure, purpose, installation level, and material, including main distribution boards, sub-distribution boards, and lighting distribution boxes.

Structural and Purpose-

Based Classification

Distribution boxes can be divided into power distribution boxes and lighting distribution boxes, which serve as the final equipment in a distribution system. They are low-voltage devices that assemble switchgear, protective devices, measuring instruments, and auxiliary equipment into enclosed or semi-enclosed cabinets ( ). Types based on structural characteristics: Fixed Panel Switchgear: Open-type switchgear with panel shielding, offering low protection, suitable for industrial or mining enterprises with low continuity requirements ( ).

Protective (Enclosed) Switchgear: Fully enclosed cabinets with switches, protections, and monitoring controls, providing isolation and safety for each circuit. Often includes mechanical interlocks and protective platforms for control and measurement ( ).

Drawer-

Style Switchgear: Components are installed in withdrawable drawers, forming functional units separated from busbars or cables, with isolation measures between units ( ). Hierarchical Classification by Power Supply SystemDistribution boxes are also classified according to their position in the power supply hierarchy ( ): Primary Power Distribution Equipment: Known as power distribution centers, installed near step-down transformers, with high output capacity and electrical parameter requirements. Secondary Power Distribution Equipment: Includes power distribution cabinets and motor control centers, used for scattered or concentrated loads, providing protection, monitoring, and control.

Final Power Distribution Equipment: Typically called lighting distribution boxes, small-capacity units located far from the power supply center, distributing electricity to lighting and small loads.

Material and Installation-

Based Classification

Metal Distribution Boxes: Made of steel or aluminum, used in industrial and commercial applications for mechanical strength and durability ( ). Plastic Distribution Boxes: Made of PVC or polycarbonate, lightweight and corrosion-resistant, suitable for lighter electrical demands ( ). Indoor vs.

Outdoor Boxes: Indoor boxes are used in protected environments like homes or offices, while outdoor boxes are designed for exposure to rain, dust, and temperature variations, requiring higher IP protection ( ).

Functional Classification

Main Distribution Board (MDB): Central hub distributing electricity to various sections, equipped with busbars, MCCBs, and support equipment ( ).

Sub-

Distribution Board (SDB): Transfers electricity to specific locations such as garages, parking lots, or building sections, allowing easier control of multiple circuits ( ). Meter Panels: Track electricity usage in residential or industrial areas, containing primary switches, fuses, circuits, and RCDs for safety ( ). Control Boxes: Specialized boxes for controlling electrical equipment, including switches, controllers, and monitoring tools ( ).

This classification ensures that distribution boxes are selected and installed according to load requirements, safety standards, environmental conditions, and functional needs, providing efficient and reliable power distribution.
