

Cold aisle low loss cost

Overview

Curtain-based containment (cold or hot aisle): The lowest capital cost option. Strip curtains or solid vinyl panels mounted on a frame above the aisle. Beyond implementing basic measures such as sealing moisture out of the data center and improving air flow, aisle containment to prevent the mixing of hot and cold air stands out as a method that can dramatically reduce energy costs, minimize hot spots and improve the carbon footprint of data. In cold aisle containment, the cold aisle is enclosed. This traps the cold air directly in front of the racks, ensuring that servers always receive consistent inlet temperatures. Exact pricing varies by vendor, region, and project complexity. The ranges below reflect typical installed costs (materials plus labour, excluding engineering and fire suppression review) for retrofit projects in existing facilities.
