Common Fiber Optic Cold Splices

Overview

Fiber fast connectors (also called mechanical splices or cold connectors) are essential components in FTTH deployments.

Key Takeaways

Mechanical cold splices, including mechanical splice connectors, splice-on connectors (SOC), and fiber optic pigtails, are the most commonly used methods for joining fibers without fusion.

Mechanical Splice Connectors

Mechanical splices are the primary type of cold splice. They use a ferrule and body system to align and hold two fiber ends together precisely. The ferrule secures the fiber, while the body provides structural support and alignment with the mating fiber.

An index-matching gel is often applied inside the splice to reduce light loss and back reflection. These splices are quick to install, require no heat, and are ideal for temporary or field repairs, though they typically have slightly higher insertion loss than fusion splices.

Splice-

On Connectors (SOC)A splice-on connector is a factory-made connector attached to a fiber via a mechanical splice. The bare fiber from the cable is inserted into the SOC, which aligns it with the connector ferrule. This method combines the precision of a factory-terminated connector with the flexibility of field splicing.

Cs are widely used for single-mode fibers in data centers, telecom networks, and FTTH deployments, providing a reliable, low-loss connection without fusion equipment.

Fiber Optic Pigtails

Fiber optic pigtails are short fiber segments with a pre-terminated connector on one end and a bare fiber on the other. The bare end is mechanically spliced to the incoming fiber, while the connector end plugs into equipment or patch panels. Pigtails are extremely common in single-mode applications and are often used in optical distribution frames (ODFs) and FTTH installations.

They allow for precise, low-loss connections and simplify field termination.

Expanded-

Beam and Multi-Fiber ConnectorsSome mechanical cold splices use expanded-beam connectors or composite ferrules to join multiple fibers simultaneously. Expanded-beam designs reduce sensitivity to dirt and misalignment, making them suitable for rugged or military applications. Multi-fiber mechanical splices allow several fibers to be joined in a single connector, improving installation efficiency in high-density environments.

Summary

The most commonly used fiber optic cold splices include: Mechanical splice connectors (single-fiber, gel-assisted)Splice-on connectors (SOC)Fiber optic pigtailsExpanded-beam and multi-fiber mechanical connectors for specialized applications These cold splicing methods are preferred when fusion splicing is impractical, for temporary repairs, or when field conditions require fast, reliable installation without heat-based equipment.

Fiber Fast Connector Buying Guide: SC/APC Cold

Fiber fast connectors (also called mechanical splices or cold connectors) are essential components in FTTH deployments. This

Understanding Cold Splice: A Comprehensive Guide for Fiber Optic ...

This blog explains what a cold splice is and its importance in fiber optic installation. It outlines the process, compares it with fusion splicing, and highlights its benefits, such as speed, cost

Optical fiber cold splicing and hot melting steps

© 2026 METRA FIBER MARKET - All rights reserved

With the rapid development of FTTH fiber-to-the-home, the demand for optical fiber cold splices has also greatly increased. The first monitoring and sorting of optical fiber quick connectors

Fiber Joints – connectors, alignment tolerances,

The primary methods are (a) fusion splicing for permanent, low-loss connections, (b) mechanical splices for semi-permanent joints, and (c) fiber connectors for

Fiber Splices – mechanical splicing, fusion splicing,

What are the two main types of fiber splices? The two main types are fusion splicing, which permanently melts and fuses the fiber ends together, and mechanical

The FOA Reference For Fiber Optics

Check out the "spotters guide" below and you will see the most common fiber optic connectors. (All the photos are to the same scale except the MTP, so you can

Fiber Optic Cable Splice: The Complete Guide

This guide explores everything about fiber optic cable splice —from fiber fusion splice basics to how to splice fiber cable step-by-step—covering

What is Fiber Cold Splice?

What is Fiber Cold Splice? The fiber quick splicing connector is also called field assembly connector, means only use simple splicing tools not fusion splicer to realize drop cable terminated.

Fiber Splicing Methods and Protection with Splice Closures

Discover the differences between fusion and mechanical splicing, learn how to ensure safe fiber optic splicing, and see why splice closures are essential for long-term network reliability.

Optical Distribution Frame (ODF) in Telecom: Types & Uses

An Optical Distribution Frame (ODF) is a specialized enclosure designed to manage, connect, protect, and distribute fiber optic cables in telecom and data networks. Think of it as a

Fibre Optic Termination Techniques – Wray Castle

Introduction to Fibre Optic Termination Fibre optic termination is the process of preparing the end of a fiber optic cable so it can connect to network equipment, another cable, or a patch

Visual Fault Locators
