

Distinguishing Multimode Optical Cables

Overview

Single Mode vs. Multimode Fiber Optic Cables What Is Single Mode and What Is Multimode?

Single Mode vs. Multimode Fiber: Key Differences Is Multimode Better?

.

Key Takeaways

Multimode optical cables can be distinguished by core size, jacket color, light source compatibility, and OM classification, which together determine bandwidth, distance, and application suitability.

Core Diameter and Light Propagation

Multimode fibers (MMF) feature a larger core diameter, typically 50 μm or 62.5 μm , allowing multiple light modes to propagate simultaneously. This contrasts with single-mode fibers, which have a smaller core ($\sim 9 \mu\text{m}$) and support only one light mode.

The larger core simplifies alignment and installation, making MMF cost-effective for short- to medium-distance data transmission in enterprise networks, data centers, and campus environments.

OM Classification and Performance

Multimode fibers are categorized into OM1, OM2, OM3, OM4, and OM5, each with distinct performance characteristics: OM1: 62.5 μm core, orange jacket, supports 10 Gigabit Ethernet up to ~ 33 meters, commonly uses LED light sources. OM2: 50 μm core, orange jacket, supports 10 Gigabit Ethernet up to ~ 82 meters, LED-based.

OM3: 50 μm core, aqua jacket, optimized for laser sources (VCSELs), supports 10G up to 300 meters and 40/100G up to 100 meters. OM4: 50 μm core, aqua jacket, enhanced for VCSEL lasers, supports 10G up to 550 meters, 40/100G up to 150 meters. OM5: 50 μm core, lime green jacket, designed for short wavelength division multiplexing (SWDM), supporting multiple wavelengths (850–953 nm) for high-speed data transmission up to 400G/800G.

Jacket Color Coding

Color coding helps quickly identify multimode fiber types: OM1/OM2: Orange OM3/OM4: Aqua OM5: Lime green Some vendors may use heather violet for enhanced OM4+ variants.

Light Sources

Multimode fibers typically use LEDs or VCSELs for data transmission.

LED

LEDs are suitable for OM1 and OM2 over shorter distances, while VCSELs are used for OM3, OM4, and OM5 to achieve higher speeds and longer distances.

Applications

Multimode fibers are ideal for short- to medium-range networks, such as: Enterprise LAN backbones Data centers (10G–400G links) Campus networks High-density environments requiring cost-effective, high-bandwidth connections.

Summary

To distinguish multimode optical cables, check: Core size: 50 μm vs 62.5 μm Jacket color: Orange, aqua, lime green OM type: OM1–OM5 for bandwidth and distance Light source compatibility: LED vs VCSEL Application suitability: Short- to medium-distance, high-speed networks These factors collectively determine the cable's performance, cost, and appropriate use case, enabling proper selection and installation in modern network infrastructures.

Single Mode vs. Multimode Fiber Optic Cables

What Is Single Mode and What Is Multimode? Single Mode vs. Multimode Fiber: Key Differences Is Multimode Better? Choosing The Right Fiber Optic Cable Single mode and multimode fiber optic cables are two different types of fiber optic cable aimed at different use cases. Single mode cables are typically made with a single strand of glass at their core, leading to a narrower core of the cabling, and more robust signal integrity over greater distances. They can be further divided into OS1 and OS2 cables. See more on cable matters Fiber Cables Direct
