

How thick are the circuit boards in international optical cables

Overview

Finished Thickness: The PCB has a finished thickness of 1.0mm, optimizing both structural integrity and space efficiency.

Key Takeaways

Circuit boards in fiber optic modules typically have a finished thickness around 1.0mm, though multilayer designs can vary depending on speed and application.

Typical PCB

B Thickness in Optical Modules Fiber-optic module PCBs, which are used in international optical cables and high-speed data transmission systems, generally have a finished thickness of about 1.0mm. These boards are often multilayered (e.g., 8 layers) to accommodate complex routing and high-frequency signal integrity requirements, while maintaining compact dimensions suitable for optical modules.

The copper thickness is commonly 1 ounce per square foot, which ensures efficient electrical conductivity and supports high-speed data transfer.

Standard PCB Thickness Ranges

While optical module PCBs are often thinner than standard electronics boards, general PCB thickness standards range from 0.4mm to 2.0mm, with 1.6mm being the most common for conventional electronics. Thinner boards (0.4-1.6mm)

being the most common for conventional electronics. Thinner boards (0.4-1.6mm)

0mm) are preferred in optical modules to save space and reduce signal path lengths, which is critical for high-frequency optical communication. Thicker boards are typically reserved for power electronics or industrial applications.

Factors Affecting PCB Thickness in Optical Cables

Layer Count: More layers increase total thickness; optical PCBs often use 6–12 layers depending on design complexity. **Material:** High-performance materials like MEGTRON 6 are used for thermal stability and mechanical strength, allowing thinner boards without compromising reliability. **Signal Integrity:** Impedance control and minimal signal loss are critical, so thickness is optimized to balance mechanical strength and electrical performance.

Application: Compact optical transceivers and modules require thinner PCBs, while larger telecom equipment may use slightly thicker boards for durability.

Summary

In international optical cables, the circuit boards are typically around 1.0mm thick, multilayered, and made from high-performance materials to ensure signal integrity, thermal stability, and mechanical reliability. While standard PCB thicknesses in electronics range from 0.4mm to 2.0mm, optical module PCBs are optimized for high-speed, compact applications, making 1.0mm a common choice.
