How to connect the two fiber optic cables to the switch

Overview

When connecting terminated duplex fiber optic cable between two network switches, ensure the connections are reversed between the SFP transceiver ports (connection A to B and B to A).

Key Takeaways

Use duplex fiber optic cables with compatible SFP transceivers, ensuring send and receive ports are correctly crossed between switches. Step 1: Choose the Right Fiber and SFP ModulesDetermine the type of fiber optic cable needed based on distance: multimode for runs under 1000 feet and single-mode for longer distances.

Select SF

P or SFP+ transceiver modules that match the fiber type and the bandwidth of your network switch (1G, 10G, or higher) and ensure they support duplex LC connections. Step 2: Prepare the Fiber CablesUse duplex fiber optic cables with LC connectors. You can either purchase pre-terminated cables or terminate the cables yourself using proper tools like a cleaver and connector kits.

Always inspect and clean connectors before installation to prevent signal loss. Step 3: Connect the Cables to the SwitchInsert the SFP modules into the fiber ports on each switch. Connect the two strands of the duplex cable so that the transmit (TX) port on one switch connects to the receive (RX) port on the other, and vice versa.

This ensures proper signal flow between devices. Step 4: Test the ConnectionAfter connecting, verify the link status on the switches. Most switches have LED indicators for SFP ports.

Use network testing tools to confirm connectivity and performance. If using pre-terminated cables, this step is usually straightforward; for field-terminated or spliced cables, check for low insertion loss. Optional: Splicing Fiber CablesIf you need to join two fiber cables directly, you can use fusion splicing for a permanent, low-loss connection or mechanical splicing for a temporary or less expensive solution.

Both methods require specialized equipment and careful alignment of the fiber cores.

Key Tips

Always use duplex (two-strand) fiber for SFP connections.

Ensure TX and R

X ports are crossed between switches. Clean and inspect connectors to avoid signal degradation.

Match the SF

P module type to the fiber and network speed. Consider pre-terminated cables for faster, reliable installation. Following these steps ensures a stable, high-speed fiber connection between your network switches.
