

How to install a cable management rack in a wall-mounted server rack

Overview

In this video, we walk through a complete 12U cabinet installation, covering everything from ISP handoff to final cable labeling.

Key Takeaways

To install a cable management rack in a wall-mounted server rack, select the appropriate horizontal or vertical manager, attach it securely to the rack rails, and route cables systematically using D-rings, finger ducts, or Velcro ties for organized, accessible cabling. Step 1: Choose the Right Cable Manager Horizontal cable managers are typically installed between patch panels and switches to guide cables across the rack. They come in 0U (non-rack-unit consuming) or 1U sizes with removable D-rings or brush strips.

Vertical cable managers run along the side of the rack and can include D-rings, bend radius fingers, or finger ducts to maintain proper cable bend and separation. Step 2: Prepare the Wall-Mounted Rack Ensure the wall-mounted rack is securely anchored to the wall and can support the weight of the server equipment and cable management accessories. Determine the placement of the cable manager based on cable entry points (top or bottom) and the location of patch panels, switches, and PDUs.

Step 3: Mount the Cable Manager Align the cable manager with the rack's vertical rails. For horizontal managers, attach using the included screws and a Phillips screwdriver, ensuring it is level and flush with the rack. For vertical managers, attach along the side rails, either centrally or laterally, depending on the design and available space.

Step 4: Route and Secure Cables Group cables by type (e.g., Cat6, fiber optic) or purpose (e.g., user connections vs. server connections) and route them through the cable manager. Use D-rings, finger ducts, or Velcro ties to secure cables without crimping or damaging them. Maintain proper bend radius to prevent signal degradation, especially for fiber optic cables.

Step 5: Label and Organize Label both ends of each cable for easy identification during maintenance or future upgrades. Color-code cables if desired to distinguish between different types or functions, improving visual organization and troubleshooting efficiency. **Step 6: Final Checks** Verify that all cables are securely fastened and that airflow is not obstructed.

Ensure that the cable manager does not interfere with the installation or removal of rack-mounted equipment. Perform a test by gently moving cables to confirm they remain organized and accessible. Following these steps ensures a neat, safe, and efficient cable management system in a wall-mounted server rack, improving maintenance, airflow, and scalability.
