Is indoor fiber optic cable flame retardant Installation method

Overview

These indoor fiber optic cables are used exclusively within buildings and must have a flame-retardant cable jacket to fit this purpose. Flame resistant cable may be deployed in-duct (conduit) or cable tray. When routing a cable within a building, you will also need to factor in fire prevention. Compared with outdoor use fiber cable, indoor fiber optic cable experience less temperature and mechanical stress, but they have to be fire retardant, emit a low level of smoke in case of burning and also allow a small bend radius to make them be amendable to vertical installation and handle. Finally, the jacket is the outermost layer of the cable, providing protection and flame resistance. The materials used for these components, especially the jacket, are what differentiate various types of indoor fiber cable and determine their suitability for specific applications. It features a gel-free, water-blocked core and a flame-retardant jacket, allowing safe installation inside buildings and in covered outdoor pathways. Corning Optical Communications manufactures quality flame retardant optical fiber cables for indoor applications, which comply with the requirements of the National Electric Code® (NEC® 2023) published by the National Fire Protection Agency (NFPA).
