Length of horizontal tee for cable tray

Overview

Discover our Horizontal Tees for cable tray systems. Contact us today for availabilities and receive a quote. Fast shipping for just in time delivery!

Key Takeaways

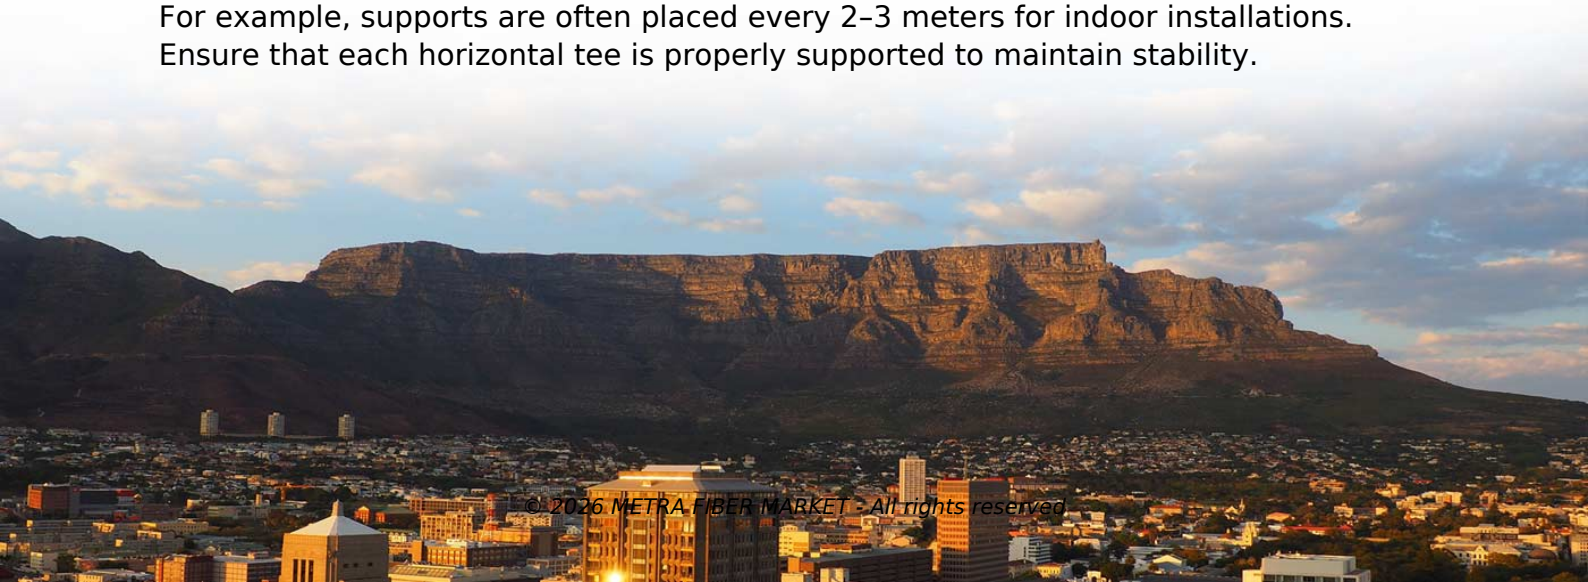

The number of horizontal tees needed depends on the layout of your cable tray system, including the number of branch points and intersections where the main tray splits into secondary runs.

Key Considerations

Identify Branch Points Horizontal tees are used where a main cable tray run splits into two directions. Count each location in your design where a branch occurs. Each branch requires one horizontal tee.

Measure Tray Lengths Determine the total length of the main and branch trays. Standard cable tray lengths are typically 12, 20, 24, or 30 feet, and the number of tees does not depend on tray length but on the number of intersections. Support Placement Supports are required at regular intervals along the tray and at each fitting, including tees.

For example, supports are often placed every 2–3 meters for indoor installations. Ensure that each horizontal tee is properly supported to maintain stability.

Layout Complexity

Single branch: 1 horizontal teeMultiple branches: Count each intersection individuallyTee with elbows: If a branch immediately turns, you may need both a tee and an elbow at the junction Practical Example If your cable tray system has a main run with three branches splitting off, you will need three horizontal tees. Additional fittings like elbows or crosses are counted separately.

Summary

To calculate the number of horizontal tees: Map your cable tray layoutCount each point where a main tray splits into a branchEach split requires one horizontal teeEnsure proper support at each fitting according to installation standards By following this method, you can accurately determine the number of horizontal tees required for your cable tray installation.
