National Backbone Optical Cable Grade

Overview

South Africa''s national broadband infrastructure company Broadband Infraco (BBI) has partnered with Huawei to build a national intelligent all-optical backbone network.

Key Takeaways

National backbone optical cables typically use single-mode, low water-peak, laser-optimized fibers compliant with ITU-T G. 652/G. 657 standards, designed for high bandwidth, long-distance, and high reliability.

Optical Fiber Type

National backbone networks primarily employ single-mode fiber (SMF) due to its low attenuation and high bandwidth over long distances, making it suitable for intercity and national transmission. These fibers are often low water-peak and laser-optimized, supporting dense wavelength division multiplexing (DWDM) and coarse WDM (CWDM) applications. Multi-mode fibers (OM1, OM3, OM4) are generally reserved for intra-building or short-distance connections and are not standard for backbone deployment.

Cable Construction and Mechanical Standards

Backbone optical cables are designed for durability and environmental resilience. Typical features include: Armored construction for direct-buried or conduit installation to protect against physical damage. High modulus aramid yarns as strength members to provide tensile strength and prevent fiber strain.

Temperature and bend tolerance: Cables are tested to withstand extreme temperatures (e.g., -40°C to +70°C) and multiple bending cycles without significant attenuation. Impact and compressive resistance to ensure reliability during installation and operation.

Performance Specifications

Attenuation: Single-mode fibers typically have attenuation below 0. 35 dB/km at 1310 nm and 0. 22 dB/km at 1550 nm, ensuring minimal signal loss over long distances.

Bandwidth: SMF supports ultra-high capacity, with modern backbone networks achieving up to 96 Tbit/s per fiber over thousands of kilometers without regeneration. Reliability: National backbone networks incorporate protection mechanisms such as Automatic Switched Optical Network (ASON) and hybrid optical-electrical systems to recover from fiber cuts within seconds.

Standards Compliance

Backbone optical cables conform to international and national standards, including: ITU-T G. 652/G. 657 for single-mode fibersNECA/FOA 301 for installation and testing practices Corning generic specifications for ribbonized and armored fiber cables These standards ensure that the cables meet minimum quality, performance, and safety requirements for national-scale deployment.

Summary

In essence, national backbone optical cables are high-grade single-mode fibers with low water-peak, laser-optimized characteristics, armored for environmental protection, and compliant with ITU-T and NECA/FOA standards. They are engineered for ultra-long-haul transmission, high bandwidth, and maximum reliability, forming the core infrastructure for national and intercity telecommunications networks.

Practical guide to fiber optic cable types for SMB and campus networks. Compare OS2 vs OM3/OM4 and OFNR/OFNP/LSZH ratings to easily

Major Recommendations: Optical

These standards provide attributes and values for optical fibres and cables which are needed to support: Network applications such as those recommended in Recommendation ITU-T G.957 up to 2.5 Gbit/s

Master Format 27 13 23 Communications Optical Fiber Backbone

PGS057 Revision 4 Corning Optical Communications reserves the right to update this specification without prior notification.

The differences between optical fiber grades A, B, C, and D

Grade A fibers are best suited for high-performance applications requiring minimal signal degradation, while Grades B and C may be adequate for less critical environments.

Standard for Installing and Testing Fiber Optics

These color codes should be used in addition to the cable color codes or colored strain-relief boots on the connectors to also designate which type of optical fiber is in the cable being connected.

SPECIFICATION STANDARD OPTICAL FIBER BACKBONE

Installation, splicing, termination, testing, labeling and documentation of new inter building fiber optic communication cable between buildings as specified and on the drawings.

Building Backbone Cabling Solution

FHD® x MTP® high-density cabling is designed for high-density data centers needing space saving and simplifying cable management. With a minimum bending radius of up to 7.5mm, FS fiber reduces

National Optical Backbone Network Solution

Its national all-optical backbone network supports single-fiber 96 Tbit/s (highest in the industry), 6000 km ultra-long-haul transmission without regeneration, and a single-span of 400 km.

National Optical Backbone Network Solution

The national all-optical backbone network solution leverages the high bandwidth, long distance, and high reliability empowered by Huawei''s advanced optical
