Selection of Fiber Optic Cables

Overview

Fiber Selection Guide Fiber Selection Guide How much fiber do you need?

- Fiber optic cables are often custom cut to match required lengths for each cable.

Key Takeaways

Choosing the right fiber optic cable depends on distance, bandwidth, environment, and future scalability, with options including singlemode and multimode fibers in various configurations and connector types.

Fiber Types

Singlemode fiber (OS2) is ideal for long-distance, high-bandwidth applications, capable of transmitting data over tens of kilometers with minimal signal loss, typically using laser sources. Multimode fiber (OM1, OM2, OM3, OM4) is suited for shorter distances, generally under 550 meters, and uses LEDs or VCSELs for light transmission. Multimode fibers differ in core size (OM1: 62.

5 µm, OM2/OM3/OM4: 50 µm), and mixing different types can cause connectivity issues.

Cable Configurations

Fiber optic cables come in various strand counts, commonly in multiples of 2 (6, 12, 24, 48, 72, 144 fibers). Engineers often include spare fibers for future upgrades or potential breaks. Non-standard fiber counts can be custom-manufactured but may require longer lead times.

Combining multiple smaller cables instead of a single large cable can simplify installation and improve accessibility.

Cable Construction and Protection

Fiber cores are made of high-purity glass surrounded by cladding and protective coatings to ensure total internal reflection and prevent signal loss. Additional strength members, such as Kevlar or gel-filled sleeves, reinforce the cable, while outer jackets protect against environmental factors like moisture, temperature, and physical stress. Outdoor cables may require UV-resistant or armored jackets.

Connector Types

Choosing the right connector is critical for network compatibility and performance. Common types include LC, SC, ST, MPO/MTP, and CS connectors. Pre-terminated solutions like MPO/MTP, Active Optical Cables (AOC), and Direct Attach Cables (DAC) can simplify installation and reduce labor costs.

Installation Considerations

Distance and bandwidth: Singlemode for long distances, multimode for short runs. Environment: Indoor, outdoor, or high-density data centers may require specific jackets or armored cables. Future scalability: Include spare fibers and consider higher-capacity cables to accommodate network growth.

Project type: New deployments favor full fiber adoption, while retrofits may use hybrid strategies combining fiber backbones with copper access layers.

Summary

Selecting fiber optic cables requires balancing performance, distance, environment, and future needs. Singlemode fibers are best for long-haul, high-speed links, while multimode fibers suit shorter, high-bandwidth applications. Proper strand count, protective construction, and compatible connectors ensure reliable, scalable, and cost-effective network deployment.
