

What is the multimode identifier on optical fiber

Overview

Multimode Fiber Types: OM1 vs OM2 vs OM3 vs OM4 vs OM5 Identified by ISO 11801 standard, multimode fiber optic cables can be classified into OM1 fiber, OM2.

Key Takeaways

Multimode optical fiber can be identified by its larger core diameter, jacket color, printed markings, connector type, and, if needed, optical measurement tools. Key Identification Methods1. Core Diameter: Multimode fiber (MMF) has a larger core diameter, typically 50 μm or 62.

5 μm , compared to single-mode fiber (SMF) which is around 9 μm . This allows multiple light modes to propagate simultaneously, making MMF suitable for short-distance communication within buildings or campuses. 2.

Jacket Color and Markings: OM1 and OM2 fibers usually have orange jackets. OM3 and OM4 fibers typically have aqua jackets, while OM5 may have lime green jackets. Fiber jackets often include printed markings indicating the type, core size, and standard compliance, which can help confirm the fiber type.

3. Connector Type: Multimode fibers commonly use ST, SC, or LC connectors with LED or VCSEL light sources, whereas single-mode fibers often use higher-cost laser-based transceivers. 4.

Optical Measurement Tools: Optical Time-Domain Reflectometer (OTDR): Can measure core properties and signal dispersion to distinguish multimode from single-mode fiber. Microscope or magnification tools: Can directly measure the core diameter. Mode analysis systems: Advanced setups, including multiplane optical conversion and photodetector arrays, can identify specific multimode fiber modes and clusters with high accuracy using deep learning techniques.

5. Performance Characteristics: MMF supports shorter distances (up to ~550 m at 10 Gbps) due to modal dispersion, while SMF supports much longer distances.

MM

F operates at 850 nm and 1300 nm wavelengths, using lower-cost electronics, making it ideal for data centers and enterprise LANs. Summary of Multimode Fiber Types

Type	Core Size	Jacket Color	Max Distance (10 Gbps)	Typical Use
OM162.5	50 µm	Orange	33 m	100 Mbps Ethernet, legacy networks
OM250	50 µm	Orange	82 m	1 Gbps Ethernet
OM350	50 µm	Aqua	300 m	10 Gbps Ethernet, data centers
OM450	50 µm	Aqua	400 m	10-100 Gbps Ethernet
OM550	50 µm	Lime Green	400 m+	SWDM, multi-wavelength high-speed networks

By combining visual inspection, connector type, core measurement, and optical testing, you can reliably identify multimode optical fiber and determine its specific type for network deployment or troubleshooting.
