Which type of grounding wire should be used for the distribution box

Overview

Each DISTRIBUTION BOX and controller must be grounded. On the US market, a 5.26 mm 2 (10 AWG) ground wire must be used, and in all other markets a 6 mm 2 must be used.

Key Takeaways

For a distribution box, use a copper grounding wire sized according to the system voltage, overcurrent protection, and local standards—typically 10 AWG (5. 26 mm²) in the US or 6 mm² internationally, with larger sizes for connections to spindles or mounting plates. Recommended Wire SizesUS Market: Use a 10 AWG (5.

26 mm²) copper wire for general grounding of the distribution box. International Markets: Use a 6 mm² copper wire for the same purpose. High-current or long-distance connections: For grounding between mounting plates and equipment like spindles, use 16 mm² internationally or 6 AWG (13.

29 mm²) in the US to maintain low resistance and ensure proper fault current flow.

Key Considerations

Material: Copper is preferred due to its low resistance and high conductivity. Aluminum may be used in some cases but requires larger cross-section to achieve equivalent conductivity. Connection Points: Attach one grounding wire from a threaded stud at the bottom of the housing to the mounting plate, and a second wire from the mounting plate to the central grounding point.

Resistance Requirements: The total ground resistance between all system parts should be less than 0. 1 ohm to ensure safety and proper operation of protective devices. Equipment Grounding Conductors (EGC): These connect non-current-carrying metal parts to the system ground, providing a low-impedance path for fault current to trip breakers quickly.

Bonding: Ensure the main bonding jumper connects the neutral conductor to the EGC at the service disconnect, maintaining continuity and safety.

Practical Tips

For panels with hinged doors or line cords, use grounding straps sized according to the breaker or fuse protecting the door-mounted equipment. Always verify local codes and NEC Table 250. 122 for the minimum grounding conductor size based on the overcurrent protection device rating.

Check that all connections are tight and corrosion-free to maintain low resistance and reliable grounding. By following these guidelines, the distribution box will have a safe, low-resistance grounding system that complies with NEC and international standards, ensuring protection against electrical faults and shock hazards.
